

Koneru Lakshmaiah Education Foundation

(Deemed to be University estd. u/s. 3 of the UGC Act, 1956)

Off-Campus: Bachupally-Gandimaisamma Road, Bowrampet, Hyderabad, Telangana - 500 043.

Phone No: 7815926816, www.klh.edu.in

RAILWAY RESERVATION SYSTEM

Team Members Details

1.CH. Sai Rohit – 2520090091

2.Akash K– 2520090127

3.Surendra Nath Reddy – 2520090142

III Year B.Tech-II Semester – CS – IT (AIML)

Under the Guidance of

Dr.M Gayatri

Associate Professor

Agenda

- Abstract
- Introduction
- Existing System
- Proposed System
- System Architecture
- Requirements Specifications
- System Models
- Conclusion

Abstract

The system streamlines ticket booking with real-time seat availability, secure online payments, instant e-ticket generation, and automated cancellation/refund processing, making the entire process faster and more user-friendly. Built on a scalable multi-tier design with RDBMS support, it ensures ACID-compliant transactions, high concurrency handling, and strong security through encrypted authentication and role-based access controls

Introduction

The template provides a clear, organized format for documenting your project, ensuring consistency across sections like objectives, methodology, and results. This helps maintain professional presentation and readability. It acts as a blueprint, guiding you on what information to include and how to arrange it, which reduces ambiguity and saves time during project documentation.

Existing System

The current system relies heavily on manual processes, which often lead to inefficiencies, errors, and delays in retrieving or processing information. The existing setup lacks proper integration between modules and does not provide easy access to data for users, making scalability and real-time decision-making difficult.

Proposed System

The proposed system introduces automated processes that reduce manual effort, minimize errors, and speed up data handling, leading to improved productivity. It ensures seamless integration between modules and provides real-time access to information, making the system more user-friendly, scalable, and reliable for decision-making.

System Architecture

The architecture is organized into distinct layers (e.g., presentation, application, and database), ensuring modularity, easier maintenance, and clear separation of responsibilities. It defines how data moves between components, emphasizing secure communication, efficient processing, and integration with external services or APIs.

Requirements Specifications

Define the core operations the system must perform, such as data input, processing, storage, and retrieval. These requirements ensure the system delivers the expected functionality to end users. Specify performance, security, scalability, and usability standards. These requirements guarantee that the system not only works correctly but also operates efficiently and reliably under different conditions.

System Models

System models provide visual or structured representations (like data flow diagrams, ER diagrams, or UML models) that illustrate how different components interact, making complex processes easier to understand. They serve as a blueprint for developers and stakeholders, ensuring everyone has a clear, shared understanding of the system's functionality, requirements, and workflow before implementation.

Conclusion

The project demonstrates how a structured and automated system can overcome the limitations of the existing manual processes. By integrating efficient architecture, clear requirements, and well-defined models, the proposed solution ensures improved performance, reliability, and scalability. Overall, it provides a strong foundation for future enhancements and practical implementation.
